

Forex Robot GR

[BUTTON MYFXBOOK](#) [BUTTON CONTACT ME](#)

This is a Forex multi-currency multi-timeframe fully automated strategy, which has been back-tested from 2008 to 2023, passing all Great Economic Crises with success.

My Live Trading Strategy

In early 2024, the brokerage firm InstaForex approached me through my website, offering to fund my strategy with \$10,000. Over the past year, my strategy has successfully doubled the initial capital in a live trading environment. You can verify the real-time performance here:

<https://www.myfxbook.com/members/giannis/funded-instatrader/10605583>

Started on Live account on 2023 passing the "Black Monday", on 2024, I am now on 2025 looking to expand

the August 2024 performance was exceptionally high (+121%), but that was due to the market event (Black Monday-like volatility) which my system capitalized on. The system is designed to adapt dynamically to volatility, and risk exposure remains controlled.

| HOW IT WORKS |

1. What do I trade?

I trade ALL Forex MAJOR AND MINOR currency pairs exclusively, focusing on post-news volatility patterns on ALL TIMEFRAMES.

2. Trading Style

My strategy is fully automated and operates in the short- to medium-term range, executing trades typically within a few hours to a couple of days. It is not scalping, as it does not rely on ultra-tight spreads or millisecond execution speeds.

3. Risk Management

1. Scalability & Risk Adjustment

The strategy is highly scalable, meaning we can adjust risk exposure by reducing profitability if needed. This flexibility ensures that we can align the trading system with preferred risk parameters while maintaining consistency in performance.

2. Alternative Perspective: Understanding Drawdown & System Maintenance

Many traders fail because they misunderstand the relationship between probabilities and drawdown. Drawdowns are a normal and expected part of trading, and no strategy is immune to them.

One of the biggest challenges traders' faces is the psychological pressure of drawdowns, especially when they appear significant. However, fear often stems from poor risk management and a lack of trust in the strategy.

Like any investment, trading systems require maintenance to ensure long-term performance. Even automated strategies may need periodic adjustments to remain aligned with market conditions and sustain optimal efficiency

1. About Me

My name is Giannis (John) Christopoulos, and I am from Kalamata, Greece. I have been exclusively focused on developing and automating Forex trading strategies for the past 11 years. Through in-depth market analysis, I identified a recurring bar pattern that consistently appears after moderate to significant economic announcements, providing a reliable indication of short-term trend direction.

2. About the Pattern

The strategy is based on the Railway Track Pattern, Price Action, and the Fibonacci sequence, identifying high-probability trade setups driven by post-news volatility. Since this pattern is not dependent on tight spreads or ultra-fast execution, it performs equally well in both simulated and live conditions.

BACKTESTS

3. My Simulated Strategy (Backtested Results)

Before going live in 2024, my strategy was backtested over 15 years (2008 – 2023), achieving:

Compound Annual Growth Rate (CAGR): 90%

Win/Loss Ratio: 1.50

Profitable Trades: 59.93%

The backtest was conducted using compounding (profit reinvestment) to maximize capital growth.

LIVE VS BACKTEST

. Simulated vs. Live Performance

At the end of 2024, I conducted a new simulation to compare the live results with the backtest:

Same number of trades

Same Risk/Reward ratio

Same profitability

Same profit in both backtest and live trading

Higher Profit Factor in live trading (due to calculation differences between backtest and Myfxbook metrics)

Even the balance and equity curves match closely, confirming the robustness of the strategy across different environments.

Explanation of Trading Activity and Performance Characteristics

The trading performance table reveals a structured and strategic approach to market participation. A key observation is that there are extended periods where no trades are executed. This selective engagement suggests a disciplined methodology, focusing only on high-probability opportunities rather than maintaining continuous exposure to market fluctuations.

Another notable pattern is the occurrence of minor drawdowns preceding significant upward movements. This phenomenon can be interpreted as an essential part of the strategy, where calculated risk-taking is followed by substantial rewards. Such controlled declines before major gains indicate a well-managed risk-to-reward ratio and a trading model that withstands short-term volatility in favor of long-term profitability.

Advantages of This Approach:

Risk Management & Avoidance of Unnecessary Exposure:

By not engaging in constant trading, the strategy minimizes exposure to market noise and unnecessary risks, focusing only on optimal conditions.

Capital Preservation & Selective Trading:

The absence of trades in multiple months demonstrates patience and precision, ensuring that capital is deployed only in favorable market conditions.

Psychological Strength & Discipline:

The ability to endure small, calculated drawdowns before major upswings reflects a disciplined mindset that avoids panic reactions and rash decisions.

High Profitability Relative to Risk:

The significant gains following minor pullbacks suggest that the strategy is designed to capitalize on market inefficiencies, where temporary downturns create opportunities for larger upward moves.

Adaptability to Market Conditions:

The fluctuating trading frequency indicates an adaptable strategy that does not force trades but instead waits for the most promising setups, ensuring consistency over time.

This methodology reflects a professional and systematic trading approach, ensuring capital efficiency and maximizing long-term profitability while maintaining a controlled risk profile.

ANNUAL PERFORMANCE

Explanation of Annual Performance and Strategic Resilience

The annual performance chart showcases the adaptability and robustness of the trading strategy across different economic and financial crises.

The results indicate that the system thrives during periods of market turbulence, capturing significant profit opportunities while maintaining risk control.

Key Observations:

Strong Performance in Crisis Years:

Major gains are recorded in years associated with financial crises, such as:

2008 Global Financial Crisis: 229.43%

2010–2012 Eurozone Debt Crisis: Consistently high returns

2015 Swiss Franc Shock (Francogeddon): 101.18%

2016 Brexit Crash: 86.14%

2020 COVID-19 Liquidity Crunch: 114.36%

2024 Black Monday: 86.1% (so far)

This suggests that the strategy is highly effective during market dislocations, possibly due to volatility-driven opportunities.

Selective Drawdowns & Controlled Risk Exposure:

The only notable annual drawdown occurred in 2017 (-18.55%), indicating that losses are rare and well-contained. This reinforces the principle that avoiding unnecessary trades in unfavorable conditions preserves capital and enhances long-term returns.

Performance During Low-Volatility Periods:

Years with lower returns, such as 2013–2014 and 2018, align with relatively stable market conditions. This confirms that the system does not force trades in low-opportunity environments, further emphasizing its risk-awareness and patience.

Long-Term Profitability & Sustainability:

Despite economic fluctuations, the strategy maintains an upward trajectory over the long term, demonstrating resilience and adaptability to different market cycles.

Advantages of This Trading Approach:

Crisis-Resistant: Successfully capitalizes on volatility spikes during financial turmoil.

Risk-Controlled: Only one significant losing year in over 15 years.

Adaptive to Market Conditions: Strong performance in high-volatility years and conservative trading in low-volatility years.

Long-Term Growth & Stability: The system avoids excessive exposure, ensuring consistent profitability.

This strategic approach positions the trading methodology as a robust and scalable system, capable of delivering exceptional returns while maintaining risk discipline across diverse market conditions.

BUSINESS PLAN

1. Executive Summary

The goal of this business is to create a profitable Forex Trading company leveraging a proven algorithmic strategy with over 15 years of tested results. Our model is structured to allow partners to participate in a highly profitable, low-risk trading environment while benefiting from high leverage (1:500) and offshore business advantages.

2. Business Model & Partner Participation

How It Works:

The company will be established as an offshore Forex Trading business.

All trading activities will be executed by an automated algorithmic strategy with an annual CAGR of 90%.

Partners contribute a minimum of €10,000 as an initial capital investment, where trading will be conducted using proprietary funds.

An additional €5,000/year is required to cover operational expenses and gain access to profit-sharing.

Profits are shared among partners based on their level of contribution.

What the €5,000 Annual Fee Covers:

Operational costs (company setup, accounting, compliance, legal fees).

Trading infrastructure (VPS, software subscriptions, data feeds).

Strategy maintenance & optimization (continuous algorithm updates and improvements).

Liquidity & fund management (ensuring optimal capital allocation and risk management).

3. Expected Returns & Profit-Sharing Model

Projected Returns Based on Historical Performance

4. Offshore Business Setup

Why an Offshore Structure?

Regulatory flexibility – Avoid restrictions imposed by ESMA and ASIC on leverage.

Tax efficiency – Reduced corporate taxes depending on the jurisdiction.

High leverage availability – Essential for optimizing capital efficiency and maximizing returns.

Proposed Offshore Jurisdiction:

Country: Belize / Seychelles / St. Vincent and the Grenadines

Broker: XM Global (provides 1:500 leverage and ECN-like execution)

Legal Structure: Private Forex Investment Company

Regulatory Compliance: All trading will be conducted within the framework of offshore financial regulations.

5. Risk Management & Mitigation

Drawdown control: Historical maximum drawdown of 25%, kept under strict management.

Position sizing: Risk per trade is limited to 0.5-1% of capital.

Algorithmic oversight: The strategy is continuously monitored and optimized to adapt to market conditions.

Capital preservation: Profits are reinvested based on a risk-adjusted scaling approach.

6. How to Become a Partner

Commit a minimum of €10,000 as initial capital, which will be used for proprietary trading.

Pay €5,000/year for operational costs to support the business.

Sign a partnership agreement ensuring transparency and fair profit distribution.

Gain access to live trading performance and monthly financial reports.

Receive profit distributions quarterly based on company performance.

Projected Returns Based on Historical Performance

Investment	Expected Annual Return (90% CAGR)	Operational Costs (€5,000)	Net Profit After Costs	Your 15% Profit Share
€10,000	€19,000	€5,000	€14,000	€2,100
€25,000	€47,500	€5,000	€42,500	€6,375
€50,000	€95,000	€5,000	€90,000	€13,500
